The apparent dip of the fault is 45°. It is failed to measure the true dip in the W.-E. direction. This fault may be a normal fault due to tension. Fossils are sporadically seen.

Sporadically developed of laminated layer of black color. Could be burrows and the filling of pyrite (?). Vitrified stuff at 54, 80, 90, 100% 110-120 cm.

Horizontally color change by burrow.
