0 - 35', same as Sec 1.

(+ Inside). Bist of Grayish Green to Olive (4772)
Clayey, olivine is more obvious

35 - 130'. Strange phenomenon occurs just after split; there is large swell, muds and part of the surface bubbling of clay, then many small cracks made of tiny breccia happen. Partially....

This is caused by (1) drilling, clay breccia, (2) swell by dilution of clay, the (3) polacks.

Anyway, the core is (540) siliceous clay. Green inside is also greenish until 0-35.
