SECTION DESCRIPTION

Mixed drill slurry

Grain size correlates w/ biscuiting:

- 3-4 cm thick biscuits are finer-grained,
  lock silt to fine sand-sized bioclastic
  debris

- Intervals with intact pieces > 10 cm thick -
  Slightly coarser-grained, contain 10-20% bioclastic debris (white, translucent)

- Not really laminated, but sub-fossil

E intervals - may be a single
flow unit, or composite flow
units
