Colors alternating as bands (0.1 cm to 0.5 cm in thickness) and as irregular patches and streaks. Homogeneous to mottled appearance.

White

Light gray

3,500 m

DOMINANTLY VERY PALE BROWN, BUT WITH IRREGULAR BANDS AND PATCHES OF PINK

(5YR 8/3)

White, calcareous, with a calcite core. Size decreases upward from medium sandy to clayey textured silt at the base to silt to clay at the top.

Variable colored conglomeratic unit. Pebbles ranging from 1 cm to 3.5 cm in diameter, and composed of well sorted clasts of igneous origin, and limy shale (5Y 5/4). The matrix at the base is white to light gray, and the top is dominated by nanofossils and debris.

Size of pebbles not obvious, but decreasing upward. Matrix dominantly nanofossils and debris.

Pale 3,110 m

DOMINANTLY OCCURRING AS IRREGULAR SWIRLS AND PATCHES OF DOMINANT COLORS, AND DARK GRAYISH BROWN (10YR 4/3) TO PINK

3,110 m

BASE SECTION 3 144 cm
